### 1 - EUT DESCRIPTION

Applicant: Unical Enterprises, Inc.

16960 Gale Avenue,

City of Industry, CA 91745

Trade Name: N/A

Model Name: RF3-105, RF3-205, RF3-315, RF3-325

Product Description: Earphone Serial Number: N/A

Dates of Tests: May 15, 2002 Tx Frequency: 2401-2482MHz Max. RF Output Power: 21.3dBm (134.9mW)

RF Exposure environment: General Population/Uncontrolled

Application Type: Certification FCC Rule Part(s): FCC 15 Subpart B

Note: The test data was good for test sample only. It may have deviation for other test samples.

Report #R0204041 Page 3 of 39 SAR Evaluation Report

<sup>1</sup> Specific Absorption Rate (SAR) is a measure of the rate of energy absorption due to exposure to an RF transmitting source (wireless portable device).

<sup>&</sup>lt;sup>2</sup> IEEE/ANSI Std. C95.1-1992 limits are used to determine compliance with FCC ET Docket 93-62.

# 2 - REQUIREMENTS FOR COMPLIANCE TESTING DEFINED BY THE FCC

The US Federal Communications Commission has released the report and order "Guidelines for Evaluating the Environmental Effects of RF Radiation", ET Docket No. 93-62 in August 1996 [1].

The order requires routine SAR evaluation prior to equipment authorization of portable transmitter devices, including portable telephones. For consumer products, the applicable limit is 1.6 mW/g as recommended by the ANSI/IEEE standard C95.1-1992 [6] for an uncontrolled environment (Paragraph 65). According to the Supplement C of OET Bulletin 65 "Evaluating Compliance with FCC Guide-lines for Human Exposure to Radio frequency Electromagnetic Fields", released on Jun 29, 2001 by the FCC, the device should be evaluated at maximum output power (radiated from the antenna) under "worst-case" conditions for normal or intended use, incorporating normal antenna operating positions, device peak performance frequencies and positions for maximum RF energy coupling.

### 3 - DOSIMETRIC ASSESSMENT SETUP

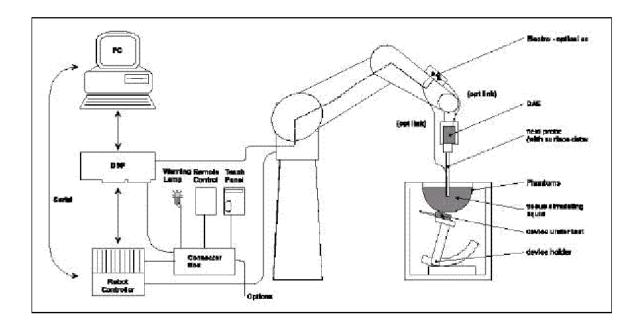

These measurements were performed with the automated near-field scanning system DASY3 from Schmid & Partner Engineering AG (SPEAG). The system is based on a high precision robot (working range greater than 0.9m) which positions the probes with a positional repeatability of better than  $\pm 0.02$ mm. Special E- and H-field probes have been developed for measurements close to material discontinuity, the sensors of which are directly loaded with a Schottky diode and connected via highly resistive lines to the data acquisition unit. The system is described in detail in [3].

The SAR measurements were conducted with the dosimetric probe ET3DV6 SN: 1577 (manufactured by SPEAG), designed in the classical triangular configuration [3] and optimized for dosimetric evaluation. The probe has been calibrated according to the procedure described in [7] with accuracy of better than  $\pm 10\%$ . The spherical isotropy was evaluated with the procedure described in [8] and found to be better than  $\pm 0.25$ dB.

The phantom used was the \Generic Twin Phantom" described in [4]. The ear was simulated as a spacer of 4 mm thickness between the earpiece of the phone and the tissue simulating liquid. The Tissue simulation liquid used for each test is in according with the FCC OET65 supplement C as listed below.

Ingredients	Frequency (MHz)									
(% by weight)	45	0	83	35	9	15	19	00	24	50
Tissue Type	Head	Body	Head	Body	Head	Body	Head	Body	Head	Body

### 3.1 Measurement System Diagram

The DASY3 system for performing compliance tests consist of the following items:

- 1. A standard high precision 6-axis robot (Stäubli RX family) with controller and software.
- 2. An arm extension for accommodating the data acquisition electronics (DAE).
- 3. A dosimetric probe, i.e., an isotropic E-field probe optimized and calibrated for usage in tissue simulating liquid. The probe is equipped with an optical surface detector system.
- 4. A data acquisition electronic (DAE), which performs the signal amplification, signal multiplexing, AD-conversion, offset measurements, mechanical surface detection, collision detection, etc. The unit is battery powered with standard or rechargeable batteries. The signal is optically transmitted to the EOC.
- 5. A unit to operate the optical surface detector, which is connected to the EOC. The Electro-optical coupler (EOC) performs the conversion from the optical into a digital electric signal of the DAE. The EOC is connected to the PC plug-in card. The functions of the PC plug-in card based on a DSP is to perform the time critical task such as signal filtering, surveillance of the robot operation fast movement interrupts.
- 6. A computer operating Windows 95 or larger
- 7. DASY3 software
- 8. Remote control with teaches pendant and additional circuitry for robot safety such as warning lamps, etc.
- 9. The generic twin phantom enabling testing left-hand and right-hand usage.
- 10. The device holder for handheld EUT.
- 11. Tissue simulating liquid mixed according to the given recipes (see Application Note).
- 12. System validation dipoles to validate the proper functioning of the system.

#### 3.2. System Components

#### **ET3DV5 Probe Specification**

Construction Symmetrical design with triangular core Built-in optical fiber for surface detection System Built-in shielding against static charges Calibration In air from 10 MHz to 2.5 GHz In brain and muscle simulating tissue at Frequencies of 450 MHz, 900 MHz and 1.8 GHz (accuracy  $\pm$  8%)

Frequency 10 MHz to > 6 GHz; Linearity: ± 0.2 dB (30 MHz to 3 GHz)

Directivity  $\pm 0.2$  dB in brain tissue (rotation around probe axis)

 $\pm$  0.4 dB in brain tissue (rotation normal probe axis)

Dynamic 5 mW/g to > 100 mW/g;

Range Linearity:  $\pm 0.2 \text{ dB}$ 

Surface  $\pm$  0.2 mm repeatability in air and clear liquids

Detection over diffuse reflecting surfaces. Dimensions Overall length: 330 mm

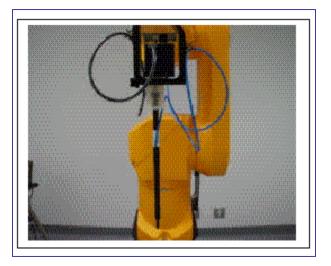

Tip length: 16 mm Body diameter: 12 mm Tip diameter: 6.8 mm

Distance from probe tip to dipole centers: 2.7 mm Application General dosimetric up to 3 GHz

Compliance tests of mobile phones

Fast automatic scanning in arbitrary phantoms

The SAR measurements were conducted with the dosimetric probe ET3DV6 designed in the classical triangular configuration and optimized for dosimetric evaluation. The probe is constructed using the thick film technique; with printed resistive lines on ceramic substrates. The probe is equipped with an optical multi-fiber line ending at the front of the probe tip. It is connected to the EOC box on the robot arm and provides an automatic detection of the phantom surface. Half of the fibers are connected to a pulsed infrared transmitter, the other half to a synchronized receiver. As the probe approaches the surface, the reflection from the surface produces a coupling from the transmitting to the receiving fibers. This reflection increases first during the approach, reaches maximum and then decreases. If the probe is flatly touching the surface, the coupling is zero. The distance of the coupling maximum to the surface is independent of the surface reflectivity and largely independent of the surface to probe angle. The DASY3 software reads the reflection during a software approach and looks for the maximum using a 2 nd order fitting. The approach is stopped when reaching the maximum.

Photograph of the probe

Inside view of ET3DV6 E-field Probe

#### **E-Field Probe Calibration Process**

Each probe is calibrated according to a dosimetric assessment procedure described in [6] with accuracy better than +/- 10%. The spherical isotropy was evaluated with the procedure described in [7] and found to be better than +/-0.25dB. The sensitivity parameters (NormX, NormY, NormZ), the diode compression parameter (DCP) and the conversion factor (ConvF) of the probe are tested.

The free space E-field from amplified probe outputs is determined in a test chamber. This is performed in a TEM cell for frequencies bellow 1 GHz, and in a waveguide above 1 GHz for free space. For the free space calibration, the probe is placed in the volumetric center of the cavity and at the proper orientation with the field. The probe is then rotated 360 degrees.

E-field temperature correlation calibration is performed in a flat phantom filled with the appropriate simulated brain tissue. The measured free space E-field in the medium correlates to temperature rise in dielectric medium. For temperature correlation calibration a RF transparent thermistor-based temperature probe is used in conjunction with the E-field probe.

#### **Data Evaluation**

The DASY3 software automatically executes the following procedures to calculate the field units from the microvolt readings at the probe connector. The parameters used in the evaluation are stored in the configuration modules of the software:

Probe Parameter:	-Sensitivity	$Norm_i$ , $a_{i0}$ , $a_{i1}$ , $a_{i2}$
	-Conversion Factor	ConvFi
	-Diode compression point	$Dcp_i$
Device parameter:	-Frequency	f
·	-Crest Factor	cf
Media parameter:	-Conductivity	σ
_	-Density	ρ

These parameters must be set correctly in the software. They can either be found in the component documents or be imported into the software from the configuration files issued for the DASY3 components. In the direct measuring mode of the multi-meter option, the parameters of the actual system setup are used. In the scan visualization and export modes, the parameters stored in the corresponding document files are used.

The first step of the evaluation is a linearization of the filtered input signal to account for the compression characteristics of the detector diode. The compensation depends on the input signal, the diode type and the DC-transmission factor from the diode to the evaluation electronics. If the exciting field is pulsed, the crest factor of the signal must be known to correctly compensate for peak power. The formula for each channel can be given as:

$$Vi = Ui + (Ui)^2 cf / dcp_i$$

With Vi = compensated signal of channel i (i = x, y, z)
Ui = input signal of channel i (i = x, y, z)
cf = crest factor of exciting field (DASY parameter)
dcp<sub>i</sub> = diode compression point (DASY parameter)

Report #R0204041 Page 8 of 39 SAR Evaluation Report

From the compensated input signals the primary field data for each channel can be evaluated:

E-field probes: 
$$E_{i} = \sqrt{\frac{V_{i}}{Norm_{i} \cdot ConvF}}$$
H-field probes: 
$$H_{i} = \sqrt{Vi} \cdot \frac{a_{i0} + a_{i1}f + a_{i2}f^{2}}{f}$$

With Vi = compensated signal of channel i (i =x, y, z)

 $Norm_i = sensor sensitivity of channel i (i = x, y, z)$ 

 $\mu V/(V/m)^2$  for E-field probes

ConF = sensitivity enhancement in solution

a<sub>ii</sub> = sensor sensitivity factors for H-field probes

f = carrier frequency [GHz]

Ei = electric field strenggy of channel i in V/m H<sub>i</sub> = diode compression point (DASY parameter)

The RSS value of the field components gives the total field strength (Hermitian magnitude):

$$E_{tot} = Square Root [(E_x)^2 + (E_y)^2 + (E_z)^2]$$

The primary field data are used to calculate the derived field units.

$$SAR = (E_{tot})^2 \cdot \sigma / (\rho \cdot 1000)$$

With SAR = local specific absorption rate in mW/g

 $E_{tot}$  = total field strength in V/m

 $\sigma$  = conductivity in [mho/m] or [Siemens/m]

 $\rho$  = equivalent tissue density in g/cm<sup>3</sup>

Note that the density is normally set to 1 (or 1.06), to account for actual brain density rather than the density of the simulation liquid.

The power flow density is calculated assuming the excitation field as a free space field.

$$P_{\text{nwe}} = (E_{\text{tot}})^2 / 3770 \text{ or } P_{\text{nwe}} = (H_{\text{tot}})2 \cdot 37.7$$

With  $P_{pwe}$  = equivalent power density of a plane wave in mW/cm3

 $E_{tot}$  = total electric filed strength in V/m

 $H_{tot}$  = total magnetic filed strength in V/m

#### **Generic Twin Phantom**

The Generic Twin Phantom is constructed of a fiberglass shell integrated in a wooden table. The shape of the shell is based on data from an anatomical study designed to determine the maximum exposure in at least 90% of all users [9][10]. It enables the dosimetric evaluation of left and right hand phone usage as well as body mounted usage at the flat phantom region. A cover prevents the evaporation of the liquid. Reference markings on the Phantom allows the complete setup of all predefined phantom positions and measurement grids by manually teaching three points in the robot. Shell Thickness  $2 \pm 0.1$  mm

Filling Volume Approx. 20 liters Dimensions 810 x 1000 x 500 mm (H x L x W)

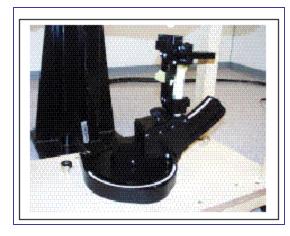

Generic Twin Phantom

#### **Device Holder for Transmitters**

In combination with the Generic Twin Phantom V3.0, the Mounting Device enables the rotation of the mounted transmitter in spherical coordinates whereby the rotation points is the ear opening. The devices can be easily, accurately, and repeatedly positioned according to the FCC and CENELEC specifications. The device holder can be locked at different phantom locations (left head, right head, flat phantom).

\* Note: A simulating human hand is not used due to the complex anatomical and geometrical structure of the hand that may produced infinite number of configurations [10]. To produce the worst-case condition (the hand absorbs antenna output power), the hand is omitted during the tests.

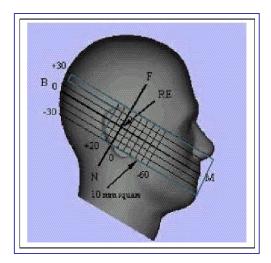

**Device Holder** 

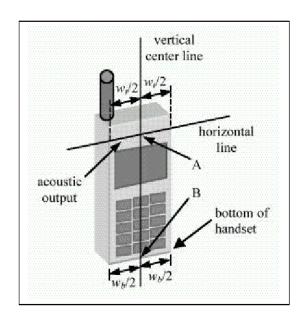

### 3.3. EUT Arrangement

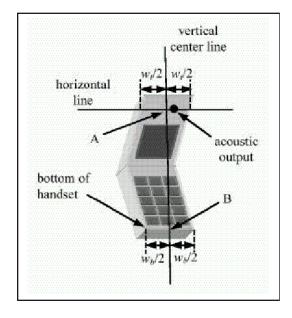

#### **Handset Test Position**

#### ----HEAD POSTION----

The device was placed in a normal operating position with the Point A on the device, as illustrated in following drawing, aligned with the location of the RE(ERP) on the phantom. With the earpiece pressed against the head, the vertical center line of the body of the handset was aligned with an imaginary plane consisting of the RE, LE and M. While maintaining these alignments, the body of the handset was gradually moved towards the cheek until any point on the mouth-piece or keypad contacted the cheek. This is a cheek/touch position. For ear/tilt position, while maintain the device aligned with the BM and FN lines, the device was pivot against ERP back for 15° or until the device antenna touch the phantom. Please refer to IEEE SC-2 P1528 illustration Below.

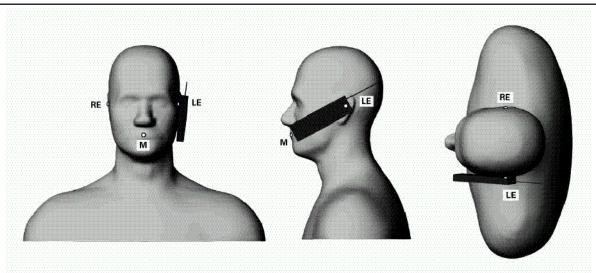

Figure – Phone position 1, "cheek" or "touch" position. The reference points for the right ear (RE), left ear (LE) and mouth (M), which define the reference plane for phone positioning, are indicated. The shoulders are shown for illustration purposes only .

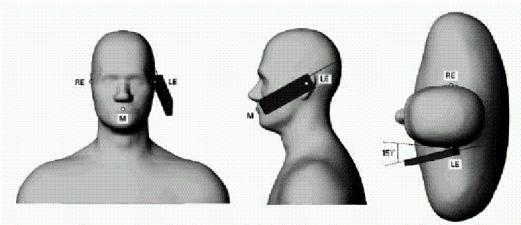

Figure – Phone position 2, "tilted position." The reference points for the right ear (RE), left ear (LE) and mouth (M), which define the reference plane for phone positioning, are indicated. The shoulders are shown for illustration purposes only.

Body-Worn Test Setup

----Body Holster Configuration----

The body holster configuration is used for body-worn devices that have a body holster accessory. Typically, a holster or carrying case is provided or available as an accessory item for supporting headset and body-worn operations. SAR may vary depending on the body separation distance provided by the type of holster and batteries supplied for a phone. Generally, the design of the holster allows the phone to be positioned only with the keypad facing away from the phantom. Proper usage of the holster restricts the antenna to a specified distance away from the surface of the body. For this test the EUT is placed into the holster and the holster is positioned against the surface of the phantom in a normal operating position. The Ear-Microphone wire is then connected to the phone to simulate hands-free operation in a body holster configuration. Since this EUT does not supply any body worn accessory to the end user a distance of 15mm from the EUT back surface to the liquid interface is configured for the generic test.

Report #R0204041 Page 13 of 39 SAR Evaluation Report

### 3.4 Measurement Uncertainty

The uncertainty budget has been determined for the DASY3 measurement system according to the NIS81 [13] and the NIST1297 [14] documents and is given in the following Table.

Uncertainty Description	Error	Distribution	Weight	Standard Deviation	Offset			
	Pro	be Uncertainty						
Axial isotropy	$\pm 0.2 \text{ dB}$	U-shape	0.5	±2.4 %	/			
Spherical isotropy	±0.4 dB	U-shape	0.5	±4.8 %	/			
Isotropy from gradient	±0.5 dB	U-shape	0	/	/			
Spatial resolution	±0.5 %	Normal	1	±0.5 %	/			
Linearity error	±0.2 dB	Rectangle	1	±2.7 %	/			
Calibration error	±3.3 %	Normal	1	± 3.3 %	/			
SAR Evaluation Uncertainty								
Data acquisition error	±1%	Rectangle	1	±0.6 %	/			
ELF and RF disturbances	±0.25 %	Normal	1	±0.25 %	/			
Conductivity assessment	±10 %	Rectangle	1	± 5.8 %	/			
SI	oatial Peak SA	AR Evaluation	Uncertaint	y				
Extrapol boundary effect	±3%	Normal	1	±3%	± 5%			
Probe positioning error	±0.1 mm	Normal	1	± 1%	/			
Integrat. and cube orient	±3%	Normal	1	±3%	/			
Cube shape inaccuracies	±2%	Rectangle	1	±1.2 %	/			
Device positioning	±6%	Normal	1	± 6%	/			
Combined Uncertainties	/	/	1	±11.7 %	± 5%			
Extended uncertainty (K = 2)	/	/	/	± 23.5 %.	/

### 5 - EVALUATION PROCEDURE

### 5.1 Simulated Tissue Liquid Parameter Confirmation

The dielectric parameters were checked prior to assessment using the HP85070A dielectric probe kit. The dielectric parameters measured are reported in each correspondent section:

### 5.2 System Accuracy Verification

Prior to the assessment, the system validation kit was used to test whether the system was operating within its specifications of  $\pm 10\%$ . The validation results are tabulated below. And also the corresponding SAR plot is attached as well in the SAR plots files.

IEEE P1528 recommended reference value

Frequency (MHz)	1 g SAR	10 g SAR	Local SAR at surface (above feed point)	Local SAR at surface (v=2cm offset from feed point)
300	3.0	2.0	4.4	2.1
450	4.9	3.3	7.2	3.2
835	9.5	6.2	14.1	4.9
900	10.8	6.9	16.4	5.4
1450	29.0	16.0	50.2	6.5
1800	38.1	19.8	69.5	6.8
1900	39.7	20.5	72.1	6.6
2000	41.1	21.1	74.6	6.5
2450	52.4	24.0	104.2	7.7
3000	63.8	25.7	140.2	9.5

### System validation result

Freq [MHz]	Parameters	Liquid Temp [°C]	Target Value	Measured Value	Deviation [%]	Limits [%]
	$\epsilon_{ m r}$	23.4	40.0	41.2	+3.0	±5
1800	σ	23.4	1.40	1.36	-2.9	±5
	1g SAR	23.4	38.1	38.4	+0.7	±10

 $\epsilon_r$  = relative permittivity,  $\sigma$  = conductivity and  $\rho$ =1000kg/m<sup>3</sup>

Note: Input power = 56.3mW

### Validation Dipole 1800MHz

### Dipole 1800 MHz

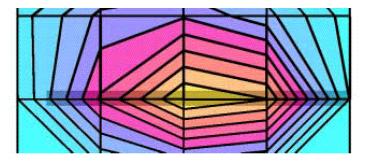

SAM Phantom; Flat Section; Position: (90°,90°); Frequency: 1800 MHz

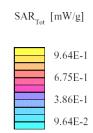

Probe: ET3DV6 - SN1604; ConvF(5.68,5.68,5.68); Crest factor: 1.0; Head 1800 MHz:  $\sigma = 1.36 \text{ mho/m} \ \epsilon_r = 41.2 \ \rho = 1.00 \ g/cm^3$ 

Cubes (2): SAR (1g): 2.16  $\,$  mW/g  $\pm$  0.01 dB, SAR (10g): 0.911  $\,$  mW/g  $\pm$  0.02 dB, (Worst-case extrapolation)

Coarse: Dx = 20.0, Dy = 20.0, Dz = 10.0

Powerdrift: -0.08 dB

#### **5.3 SAR Evaluation Procedure**

The evaluation was performed with the following procedure:

- **Step 1:** Measurement of the SAR value at a fixed location above the ear point or central position was used as a reference value for assessing the power drop.
- **Step 2**: The SAR distribution at the exposed side of the head was measured at a distance of 3.9 mm from the inner surface of the shell. The area covered the entire dimension of the head or EUT and the horizontal grid spacing was 20 mm x 20 mm. Based on these data, the area of the maximum absorption was determined by spline interpolation.
- **Step 3**: Around this point, a volume of 32 mm x 32 mm x 34 mm was assessed by measuring 5 x 5 x 7 points. On the basis of this data set, the spatial peak SAR value was evaluated under the following procedure:
  - 1. The data at the surface were extrapolated, since the center of the dipoles is 2.7 mm away from the tip of the probe and the distance between the surface and the lowest measuring point is 1.2 mm. The extrapolation was based on a least square algorithm [11]. A polynomial of the fourth order was calculated through the points in z-axes. This polynomial was then used to evaluate the points between the surface and the probe tip.
  - 2. The maximum interpolated value was searched with a straightforward algorithm. Around this maximum the SAR values averaged over the spatial volumes (1 g or 10 g) were computed by the 3D-Spline interpolation algorithm. The 3D-Spline is composed of three one dimensional splines with the "Not a knot"-condition (in x, y and z-directions) [11], [12]. The volume was integrated with the trapezoidal-algorithm. One thousand points (10 x 10 x 10) were interpolated to calculate the average.
  - 3. All neighboring volumes were evaluated until no neighboring volume with a higher average value was found.

**Step 4**: Re-measurement of the SAR value at the same location as in Step 1. If the value changed by more than 5%, the evaluation was repeated.

### **5.4 Exposure Limits**

Table 1: Limits for Occupational/Controlled Exposure (mW/g)

Whole-Body	Partial-Body	Hands. Wrists. Feet and Ankles
0.4	8.0	20.0

Table 2: Limits for General Population/Uncontrolled Exposure (mW/g)

Whole-Body	Partial-Body	Hands. Wrists. Feet and Ankles
0.08	1.6	4.0

Note: Whole-body SAR is averaged over the entire body, partial-body SAR is averaged over any 1 gram of tissue defined as a tissue volume in the shape of a cube SAR for hands, writs, feet and ankles is averaged over any 10 grams of tissue defined as a tissue volume in the shape of a cube.

Population/Uncontrolled Environments are defined as locations where there is the exposure of individual who have no knowledge or control of their exposure.

Occupational/Controlled Environments are defined as locations where there is exposure that may be incurred by people who are aware of the potential for exposure (i.e. as a result of employment or occupation).

Population/uncontrolled environments Partial-body limit 1.6mW/g applied to the EUT.

Report #R0204041 Page 19 of 39 SAR Evaluation Report

## 6 - TEST RESULTS

This page summarizes the results of the performed dosimetric evaluation. The plots with the corresponding SAR distributions, which reveal information about the location of the maximum SAR with respect to the device could be found in the following pages.

### 6.1 Left Head Configuration

Position	Ch	Frequency	Conducted Power	Worst case SAR, aver	raged over 1g (mW/g)

### DASY - DOSIMETRIC ASSESSMENT SYSTEM

# CALIBRATION REPORT

### DATA ACQUISITION ELECTRONICS

MODEL:

DAE3 V1

SERIAL NUMBER:

456

This Data Acquisition Unit was calibrated and tested using a FLUKE 702 Process Calibrator. Calibration and verification were performed at an ambient temperature of  $23 \pm 5$  °C and a relative humidity of < 70%.

Measurements were performed using the standard DASY software for converting binary values, offset compensation and noise filtering. Software settings are indicated in the reports.

Results from this calibration relate only to the unit calibrated.

Calibrated by:

E. Meyer

Calibration Date:

June 21, 2001

**DASY Software Version:** 

**DASY3 V3.1c**

# **Calibration Certificate**

### **Dosimetric E-Field Probe**

Type:	ET3DV6	
Serial Number:	1604	
Place of Calibration:	Zurich	
Date of Calibration:	September 7, 2001	
Calibration Interval:	12 months	

Schmid & Partner Engineering AG hereby certifies, that this device has been calibrated on the date indicated above. The calibration was performed in accordance with specifications and procedures of Schmid & Partner Engineering AG.

Wherever applicable, the standards used in the calibration process are traceable to international standards. In all other cases the standards of the Laboratory for EMF and Microwave Electronics at the Swiss Federal Institute of Technology (ETH) in Zurich, Switzerland have been applied.

Calibrated by:

Nikoloski Newman.

Approved by:

Valuate Roja
